- MicroServices

Java Projects

Food App:

- Take customer orders and return invoices based on different parameters in the customer's request.
- GitHub [Link](#)

Rent Ride:

- Find a Car based on customer criteria and calculate ride cost.
- GitHub [Link](#)

E-Commerce Backend:

- Take orders from customers. Mainly focused on solid principles. But the product as well as how many quantities it will add to the cart after all is done proceed to the checkout stage. Major in progress for payment integration.
- GitHub [Link](#)

Library Management (Spring-Boot Project):

- It's a spring boot project. I used Postman as a frontend to hit the controller and I also used the controller handler between the inside controller and service layer.
